Bioswale Growing Media 80/20

Our Bioswale growing media is designed to provide superior drainage characteristics while also supporting a broad range of plants, which aid in bioremediation of pollutants before water reaches storm drains or moves deep into the ground to recharge our precious and dwindling groundwater reserves.

To create this material we blend sand that is specifically designed and manufactured to meet most BMP/LID manual specifications at a rate of 80% by volume sand to 20% by volume high quality greenwaste compost. NO manure or biosolids are used in our line of bioswale growing media.
